

DirOpus Reimagined v0.1.18.0

A fast, cross-platform dual-panel file manager — inspired by the classic Amiga Directory Opus.

Hi! I've been building a file manager and just released a new version — thought you might like to try it. It runs on **Windows, macOS, and Linux** (Intel & ARM), it's free and open source, and there's nothing to install — just unzip and run.

The two-panel main window (Solarized Light theme).

What it does

- **Two folders side by side** — copy, move, and compare between them, with folder tabs on each side.
- **All the file basics** — copy / move / rename / delete, drag-and-drop, and delete-to-Trash (recoverable).
- **Compare & sync** two folders with a click.
- **Cloud storage built in** — Google Drive, OneDrive, Dropbox, Amazon S3, and 50+ more, browsed like local folders.
- **Look inside archives** — open `.zip`, `.7z`, `.rar`, and `.tar` like folders.
- **Make it yours** — 36 custom buttons to launch your own tools, plus bookmarks and a built-in file viewer.
- **Themes** — Light/Dark, Dracula, Nord, and Solarized.
- **Fast to drive** — recursive search, type-ahead jumping, and full keyboard control.

New in this release (0.1.18.0): an optional setting to keep your cloud connection warm between launches, so cloud folders open **instantly** instead of waiting to reconnect each time. Plus a screenshot hotkey and a batch of polish and fixes.
